Introduction to Embedded C Programming.

University of Dar es Salaam

Introduction

- **Programming** is the process of creating a set of instructions that tell a **computer** how to perform a task.
- **Programming** can be done using a variety of computer **programming** languages, such as JavaScript, Python, C and C++.

University of Dar es Salaam

Embedded C programming

- Embedded C is one of the most popular and most commonly used Programming Languages in the development of Embedded Systems.
- An Embedded System is a system which has both the **hardware** and **software** and is designed to do a specific task.
- Embedded Software or Program allow Hardware to monitor external events (Inputs) and control external devices (Outputs) accordingly.

University of Dar es Salaam

Embedded C programming cont...

- A software program is written on a special IDE (Integrated Development Environment) on a computer and uploaded to the microcontroller for execution.
- Embedded C is basically an extension to the Standard C Programming Language with additional features.
- It uses the same syntax and semantics of the C Programming Language like **main function**, **declaration of datatypes**, **defining variables**, **loops**, **functions**, **statements**, etc.

Parts of Arduino Program

- Arduino program can be divided in three main parts;
 - values(variables and constants),
 - structure and
 - functions.

University of Dar es Salaam

The screenshot shows the Arduino IDE window titled "sketch_mar23a | Arduino 1.9.0-beta". The menu bar includes "File", "Edit", "Sketch", "Tools", and "Help". Below the menu is a toolbar with icons for checking, running, saving, uploading, and downloading. A tab labeled "sketch_mar23a" is active. The main text area contains the following code:

```
void setup() {  
  // put your setup code here, to run once:  
  
}  
  
void loop() {  
  // put your main code here, to run repeatedly:  
  
}
```

At the bottom of the window, the status bar shows "1" on the left and "Arduino Uno on COM18" on the right.

Variables(constants & data types)

❑ Constants

- HIGH | LOW
- INPUT | OUTPUT
- true | false
- integer constants
- floating point constants, etc.

University of Dar es Salaam

Data types

Data Type	Size (Bytes)	Range of Values
void	0	null
bool/boolean	1	True/False
char	1	-128 to +127
unsigned char	1	0 to 255
byte	1	0 to 255
int	2	-32,768 to 32,767
unsigned int	2	0 to 65,535
word	2	0 to 65,535
long	4	-2,147,483,648 to 2,147,483,647
unsigned long	4	0 to 4,294,967,295
float	4	-3.4028235E+38 to 3.4028235E+38
double	4	-3.4028235E+38 to 3.4028235E+38
string	-	character array

Some functions in Arduino program

□ pinMode()

- It configures the specified pin to behave either as an input or an output. Eg. pinMode (ledPin, OUTPUT);

□ digitalWrite()

- Write a HIGH or a LOW value to a digital pin.
Eg. digitalWrite (ledPin, HIGH);

□ digitalRead()

- Reads the value from a specified digital pin, either HIGH or LOW.
Eg. digitalRead(pin);

University of Dar es Salaam

Functions in Arduino program cont...

□ **analogRead()**

- Reads the value from the specified analog pin.
eg. `float value=analogRead (inPin);`

□ **analogWrite()**

- Writes an analog value (PWM wave) to a pin.
eg. `analogWrite (ledPin, Value/4);`

Time functions

❑ **delay()**

- Pauses the program for the amount of time (in milliseconds) specified as parameter. (There are 1000 milliseconds in a second.)

eg. `delay(1000);`

❑ **delayMicroseconds()**

- Pauses the program for the amount of time (in microseconds) specified as parameter. There are million microseconds in a second.

eg. `delayMicroseconds(10000)`

❑ Other time functions include; **millis()** and **micros()**

Some control structures in Arduino program

□ If

if (conditional) and ==, !=, <, > (comparison operators)

- If, is used in conjunction with a comparison operator, tests whether a certain condition has been reached, such as an input being above a certain number.
- Syntax;

```
if (SensorValue<25) {  
  //do something  
}
```

University of Dar es Salaam

Control structure cont...

□ If...else

- if/else allows greater control over the flow of code than the basic if statement, by allowing multiple tests to be grouped together.
- Syntax;

```
if (SensorValue<25) {  
  //Action A  
}  
else {  
  //Action B  
}
```

University of Dar es Salaam

Control structure cont...

❑ for statement

- The for statement is used to repeat a block of statements enclosed in curly braces. An increment counter is usually used to increment and terminate the loop.

```
for(int x = 0; x < 100; x++){  
    println(x); // prints 0 to 99  
}
```

University of Dar es Salaam

Control structure cont...

□while

- while loops will loop continuously, and infinitely, until the expression inside the parenthesis, () becomes false.

- Syntax;

```
while(expression){  
    //statement(s)  
}
```

University of Dar es Salaam

Other control structures you need to know

- switch case
- do...while
- break
- continue
- return
- goto
